"Of all the emerging memory technologies, HMC is the one that will likely have the most impact in the long run."

HITTING THE MEMORY WALL

Traditional DRAM technology has hit a wall. For network system development beyond 100 Gb/s, efficiency and performance gains are increasingly smaller and harder to achieve. A higher-performance memory solution is needed for data packet processing, data packet buffering, and storage applications.

For enterprise and computing applications, the challenges include higher-performance processing and exponential bit growth requirements. A more energy-efficient memory solution is a must for managing power and total cost of ownership (TCO).

THE SOLUTION IS IN THE CUBE

The memory wall seemed insurmountable—until now. Micron’s Hybrid Memory Cube (HMC) combines advanced logic and DRAM layers into one optimized 3D package that leverages through-silicon via (TSV) technology. The result is a category of memory unlike anything on the market today.

HMC performance levels break through the memory wall, delivering a high-bandwidth, energy-efficient, high-density memory system that will enrich next-generation networking and drive significant reductions in data center and supercomputing power consumption.

Your New Standard for Memory Performance

KEY APPLICATIONS

NETWORKING

HMC’s impressive 160 Gb/s bandwidth boosts networking systems’ capabilities to match line speed performance in the face of ever-increasing global demand for mobility and the impact of cloud services.

COMPUTING SYSTEMS

HMC’s high bandwidth, low energy/bit, pin savings, and smaller form factor are game changers for high-performance computing (HPC) applications. Plus, the abstracted interface and logic layer enables designers of next-generation system architectures to see their designs in a different light in terms of memory, system hierarchy, and overall system optimization.
