**DDR SDRAM UDIMM**

**MT8VDDDF6464A - 512MB**

For component data sheets, refer to Micron’s Web site: www.micron.com

**Features**
- 184-pin, unbuffered dual in-line memory module (UDIMM)
- Fast data transfer rates: PC2700, or PC3200
- 512MB (64 Meg x 64)
- \( V_{DD} = V_{DDQ} = 2.5V \) (-40B: \( V_{DD} = V_{DDQ} \))
- \( V_{DDSPD} = 2.3-3.6V \)
- 2.5V I/O (SSTL_2-compatible)
- Internal, pipelined double data rate (DDR) architecture; 2n-prefetch architecture
- Bidirectional data strobe (DQS) transmitted/received with data—that is, source-synchronous data capture
- Differential clock inputs (CK and CK#)
- Multiple internal device banks for concurrent operation
- Single rank
- Selectable burst lengths (BL): 2, 4, or 8
- Auto precharge option
- Auto refresh and self refresh modes: 7.8125\( \mu \)s maximum average periodic refresh interval
- Serial presence-detect (SPD) with EEPROM
- Selectable CAS latency (CL) for maximum compatibility
- Gold edge contacts

**Options**
- Operating temperature\(^1\)
  - Commercial \( (0^\circ C \leq T_A \leq +70^\circ C) \)
  - None
- Package
  - 184-pin DIMM (lead-free)
  - Y
- Memory clock, speed, CAS latency
  - -40B: 5.0ns (200 MHz), 400 MT/s, CL = 3
  1. Contact Micron for industrial temperature module offerings.

**Marking**
- -40B

General Description

The MT8VDDF6464A is a high-speed, CMOS dynamic random access 512MB memory module organized in x64 configuration. This module uses 512Mb DDR SDRAM devices with 4 internal banks.

DDR SDRAM modules use a double data rate architecture to achieve high-speed operation. The double data rate architecture is essentially a 2n-prefetch architecture with an interface designed to transfer 2 data words per clock cycle at the I/O pins. A single read or write access for DDR SDRAM modules effectively consists of a single 2n-bit-wide, one-clock-cycle data transfer at the internal DRAM core and 2 corresponding n-bit-wide, one-half-clock-cycle data transfers at the I/O pins.

A bidirectional data strobe (DQS) is transmitted externally, along with data, for use in data capture at the receiver. DQS is a strobe transmitted by the DDR SDRAM during READs and by the memory controller during WRITEs. DQS is edge-aligned with data for READs and center-aligned with data for WRITEs.

DDR SDRAM modules operate from differential clock inputs (CK and CK#); the crossing of CK going HIGH and CK# going LOW will be referred to as the positive edge of CK. Control, command, and address signals are registered at every positive edge of CK. Input data is registered on both edges of DQS, and output data is referenced to both edges of DQS, as well as to both edges of CK.

Serial Presence-Detect Operation

DDR SDRAM modules incorporate serial presence-detect. The SPD data is stored in a 256-byte EEPROM. The first 128 bytes are programmed by Micron to identify the module type and various DDR SDRAM organizations and timing parameters. The remaining 128 bytes of storage are available for use by the customer. System READ/WRITE operations between the master (system logic) and the slave EEPROM device occur via a standard I²C bus using the DIMM’s SCL (clock) and SDA (data) signals, together with SA[2:0], which provide 8 unique DIMM/EEPROM addresses. Write protect (WP) is connected to VSS, permanently disabling hardware write protect.
Electrical Specifications

Stresses greater than those listed in Table 6 may cause permanent damage to the module. This is a stress rating only, and functional operation of the module at these or any other conditions outside those indicated in each device’s data sheet is not implied. Exposure to absolute maximum rating conditions for extended periods may adversely affect reliability.

DRAM Operating Conditions

Recommended AC operating conditions are given in the DDR component data sheets. Component specifications are available on Micron's Web site. Module speed grades correlate with component speed grades, as shown in Table 7.

Design Considerations

Simulations

Micron memory modules are designed to optimize signal integrity through carefully designed terminations, controlled board impedances, routing topologies, trace length matching, and decoupling. However, good signal integrity starts at the system level. Micron encourages designers to simulate the signal characteristics of the system's memory bus to ensure adequate signal integrity of the entire memory system.

Power

Operating voltages are specified at the DRAM, not at the edge connector of the module. Designers must account for any system voltage drops at anticipated power levels to ensure the required supply voltage is maintained.
## I<sub>DD</sub> Specifications

### Table 8: I<sub>DD</sub> Specifications and Conditions – 512MB (Die Revision J)

Values are for the MT46V64M8 DDR SDRAM only and are computed from values specified in the 512Mb (64 Meg x 8) component data sheet.

Notes:
1. To avoid spurious start and stop conditions, a minimum delay is placed between $SCL = 1$ and the falling or rising edge of $SDA$.
2. This parameter is sampled.
3. For a restart condition or following a WRITE cycle.
4. The SPD EEPROM WRITE cycle time ($t_{WRC}$) is the time from a valid stop condition of a write sequence to the end of the EEPROM internal ERASE/PROGRAM cycle. During the WRITE cycle, the EEPROM bus interface circuit is disabled, $SDA$ remains HIGH due to pull-up resistance, and the EEPROM does not respond to its slave address.

Serial Presence-Detect Data

For the latest serial presence-detect data, refer to Micron's SPD page: www.micron.com/SPD.
Module Dimensions

Figure 3: 184-pin DDR UDIMM

Notes:
1. All dimensions are in millimeters (inches); MAX/MIN or typical (TYP) where noted.
2. The dimensional diagram is for reference only. Refer to the JEDEC MO document for additional design dimensions.
